

Driver Eye Gaze and Driver Behaviour on Rural and National Roads

Dr Catherine Deegan

Senior Lecturer, Institute of Technology Blanchardstown

Summary of research activity within SimRG

Dr. Catherine Deegan: Department of Engineering, IT Blanchardstown

Dr. Charles Markham: Department of Computer Science Maynooth University

Dr. Sean Commins: Department of Psychology Maynooth University

Aims

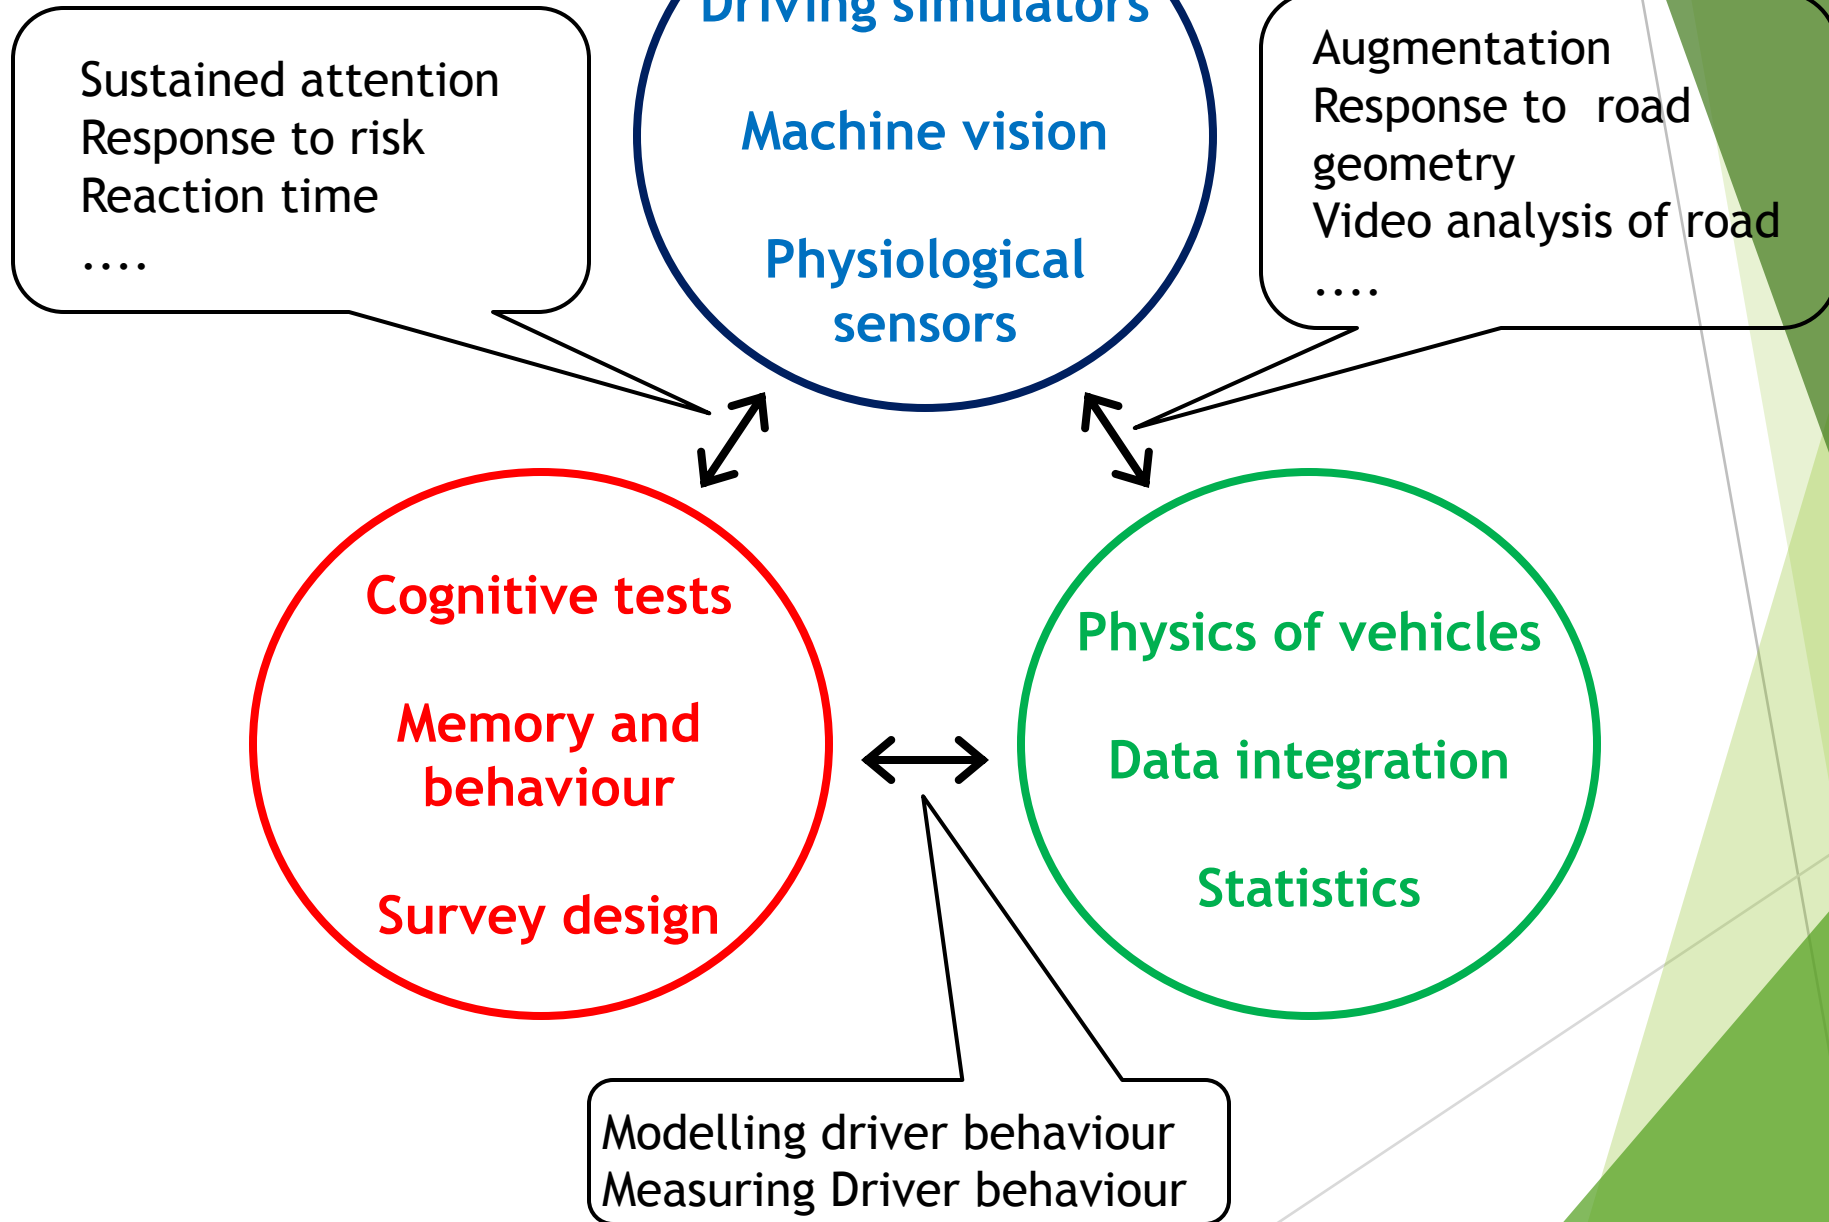

To understand the anatomy of a road accident.
data fusion, statistics

To build a model of the Irish Road Network
based on cognitive and physical models.
driver behaviour, physics of car

Provide new methods for assessment, training
and rehabilitation
returning to driving, novice drivers

Research Themes

Photorealistic simulation of Irish Roads

Most commercial driving simulators use model data

Benefits of video over model based simulators?

Model based driving simulator

Digital Map

GPS Data

Augment model

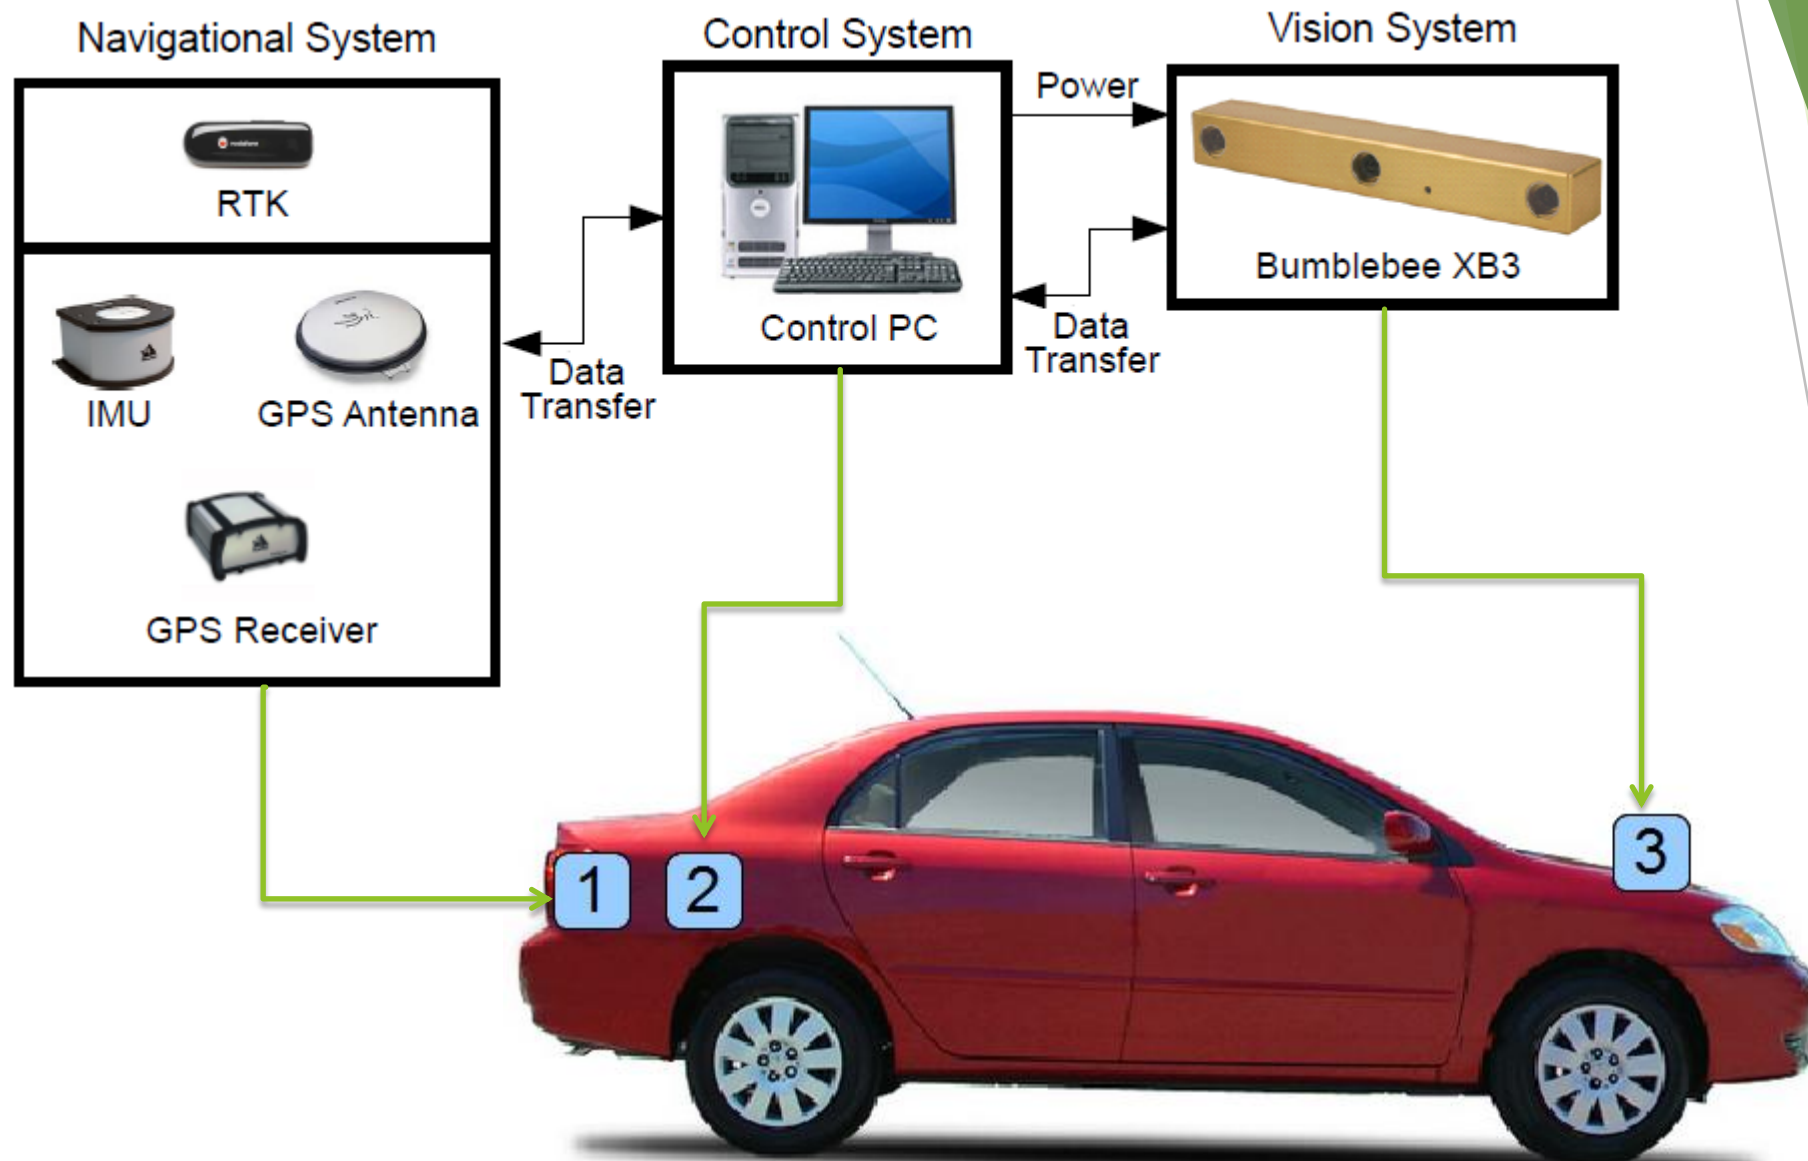

2/3D Model of road

Drive road network

Video Acquisition System

Acquisition of Video Stream

Comparison Among Three Data Sets

n = 1

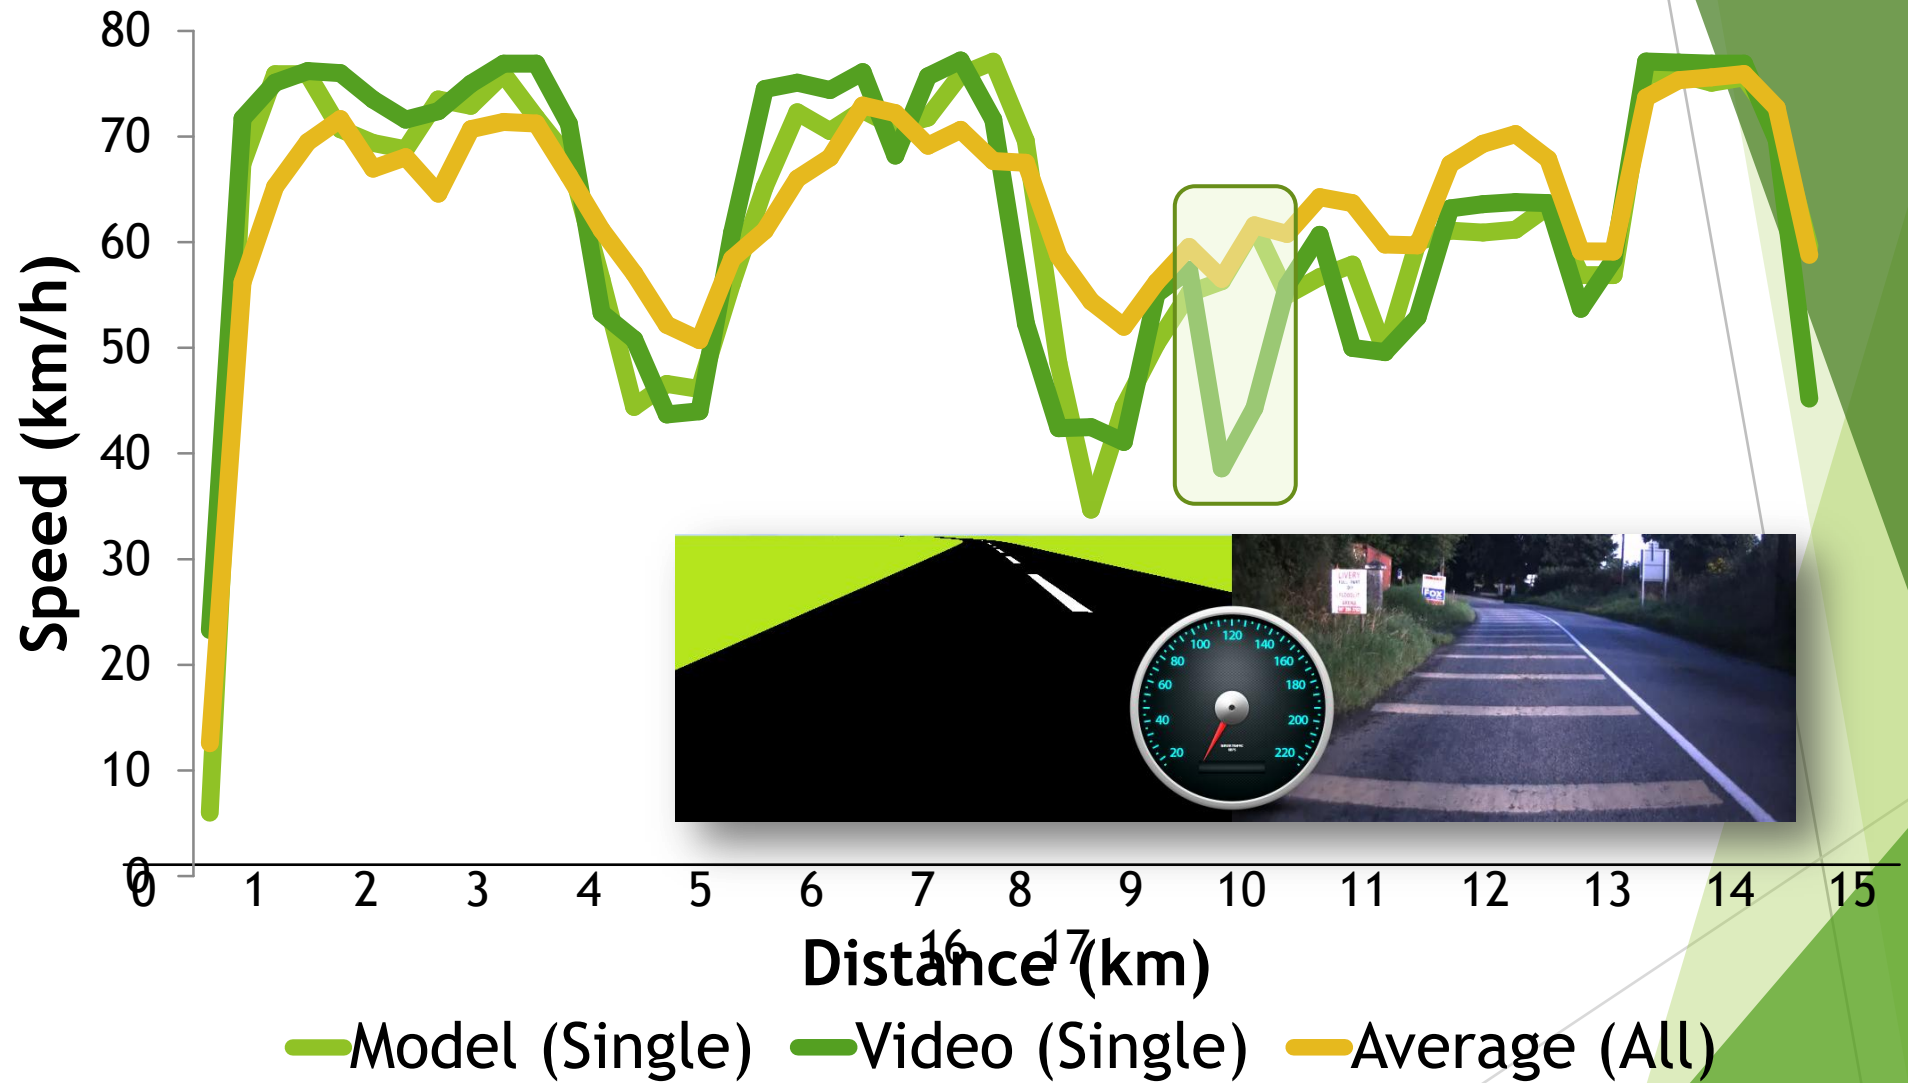

n = 11

n = 11

Ground-truth and Model: 87.3% Correlation
Ground-truth and Video: 84.6% Correlation
Video and Model: 92.8% Correlation

Results of GPS Model and Video Data

Correlation between model and video of 89%

Cognitive assessment of drivers

RSA 2012 report

11% Pedestrian

3% Road\Environment

86%
Driver

86% of accidents on Irish roads are due to driver error and behaviour

Table 36 Two Vehicle Collisions: Contributory Action, where Specified

Driver Action	Fatal	Injury	Total	%
* Drove through Stop/Yield Sign	0	37	37	13.3*
Exceeded Safe Speed	0	12	12	4.3
* Went to Wrong Side of Road	7	94	101	36.2*
Improper Overtaking	0	6	6	2.2
* Drove Through Traffic Signal	0	30	30	10.8*
Failed to Signal	0	0	0	0.0
Other Action	0	93	93	33.3
TOTAL	7	272	279	100.0

Many of these may be due to ‘cognitive’ failings’, such as

Inattention,
Distraction,
Fatigue,
Poor decision making,
Impulsivity,
Risk-taking etc.

Driver Distraction/Inattention

In Australia, distraction accounts for between 14%-33% of serious crashes (McEvoy et al., 2007).

In Norway 22% of crashes were due to distraction and inattention (Dingus et al., 2006).

We have recently shown that attention levels can affect driving behaviour and where people look.

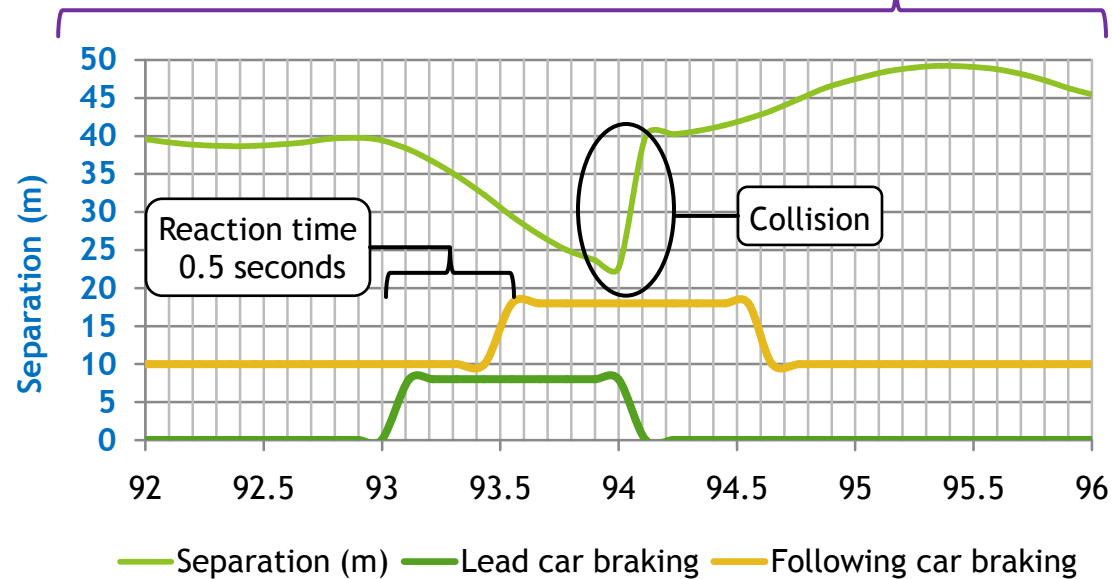

1st set of experiments:

To investigate the driving behaviour of high and low attention individuals

1. Car-following experiment (using modelled environment)
2. Driving a rural environment-measure eye gaze.
 - ▶ (1) Measured accelerator pedal, braking timing and distance from lead car.
 - ▶ (2) Measured driver eye gaze in a rural environment.

Typical sustained attention data

Average separation:
47.5m

Reaction time: 0.5s

Collisions: 2

Eye Tracking on a Rural Road-High and Low Attenders

Target area

- 1 Low attention
- 2 High attention

Pedal position

Driver view and eye-gaze

Eye Gaze Measurements

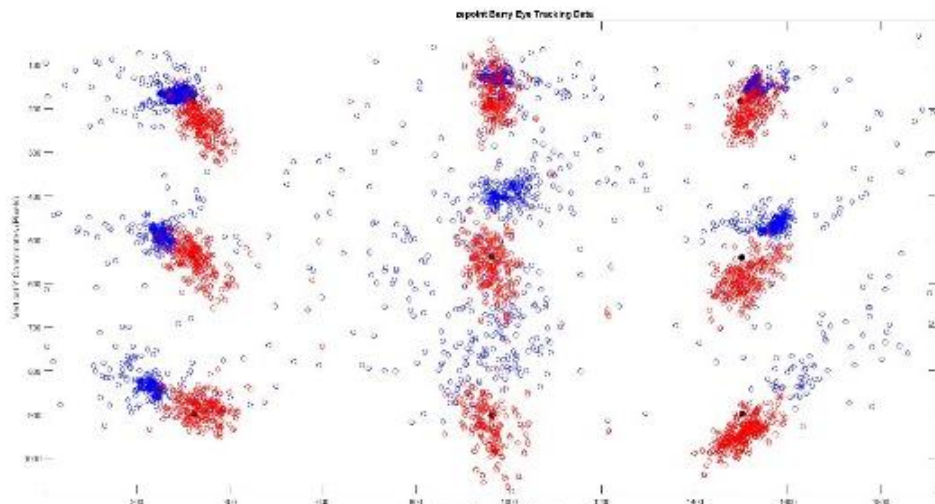

Low-Cost Eye Trackers

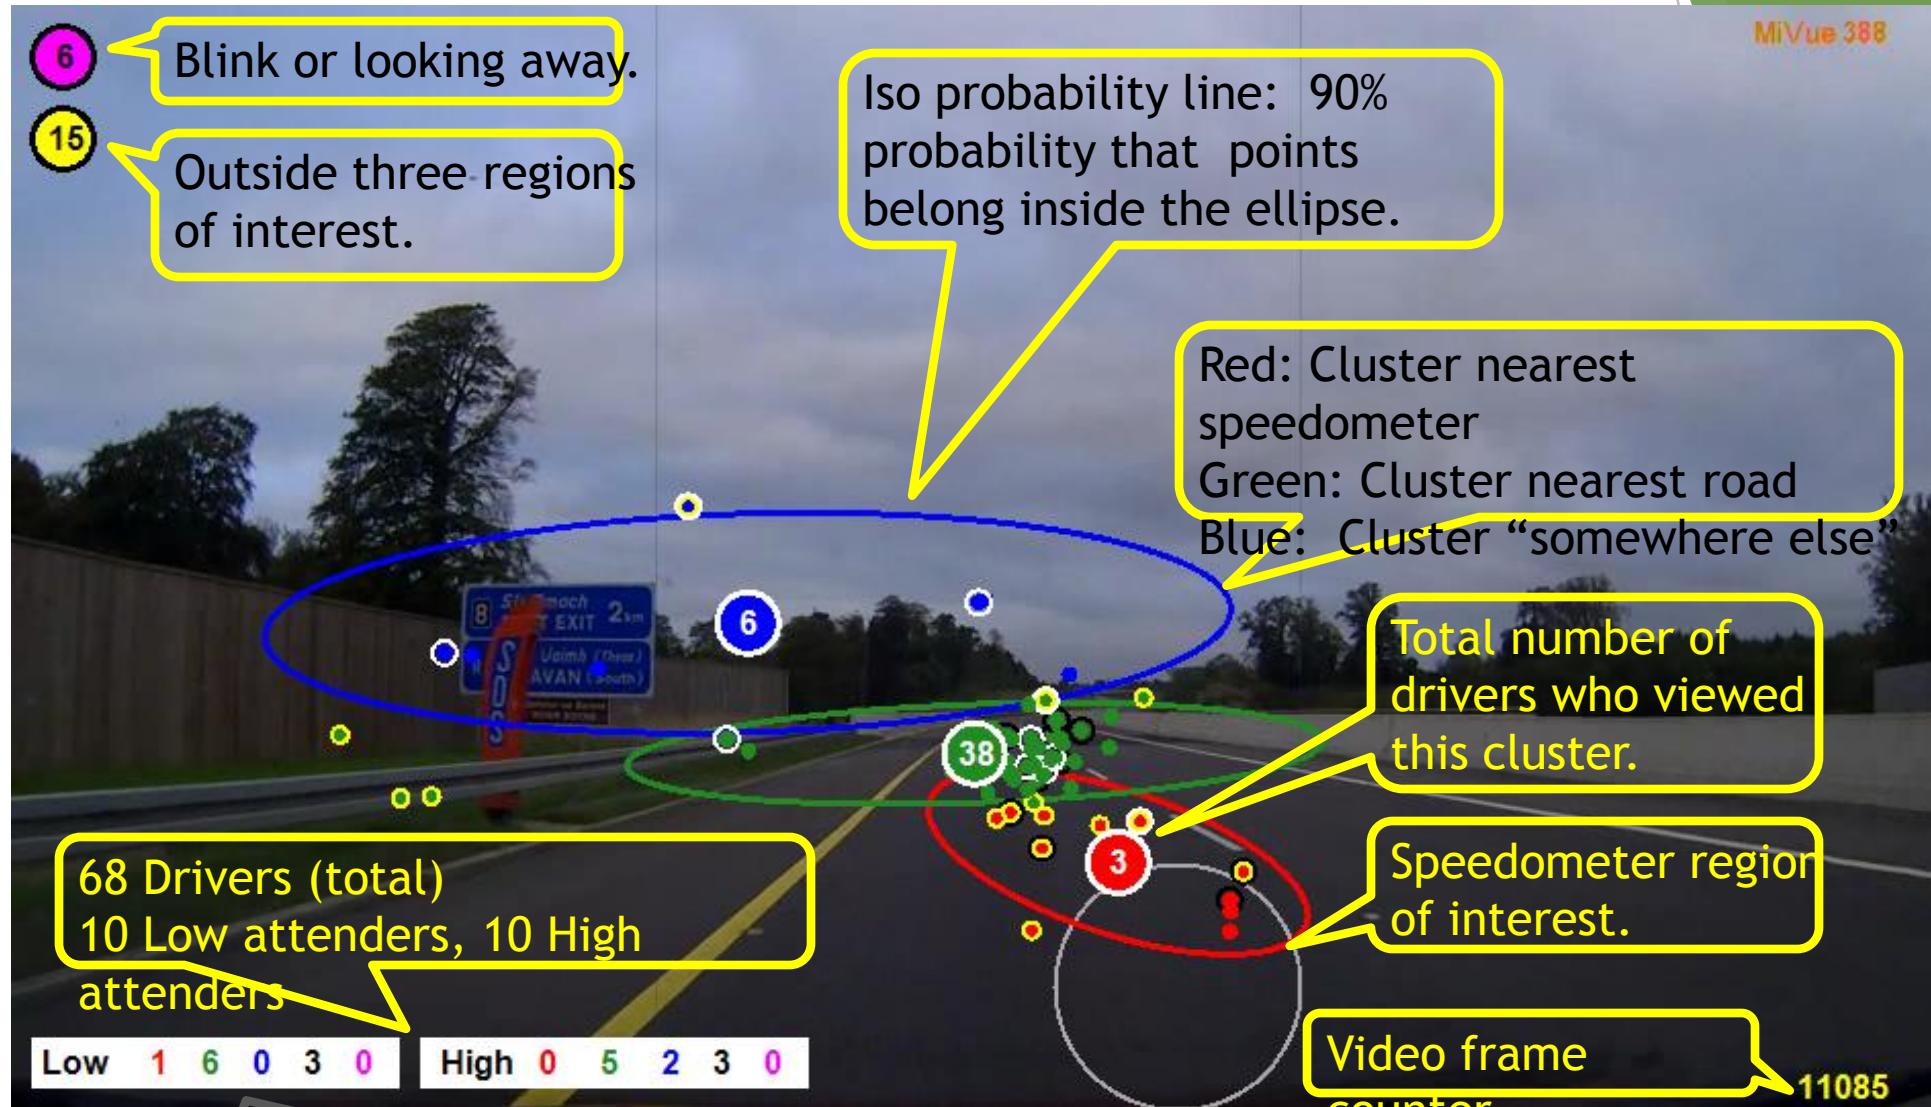

Eye Tribe

Gazepoint GP3

Advanced analysis - Where did they look?

Eye gaze count per frame

Speedometer, Road, Other, Outside cluster, Eyes sh

Inner: Cluster, Red, Green, Blue
Middle: Yellow outside ellipse
Outer: Black - Low, White - High

Rural road

Motorway

68 drivers, Red “speedo”, Green “road”, Blue “something else”

Rural– difference between high and low attenders (20pt moving average)

Frame: 340

Frame: 1389

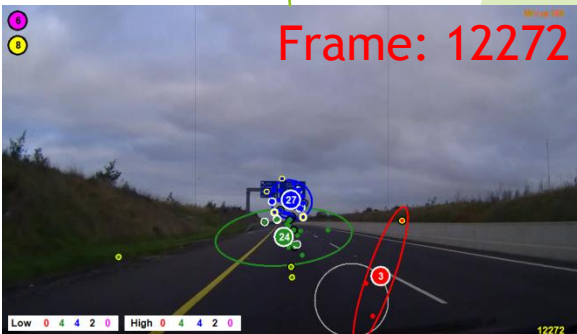

Frame: 3244

Rural road summary
 High attenders check speedometer 10% more
 Both look at road equally
 Low attenders look around 18% more

Motorway summary
 High attenders check speedometer 6% more
 Both look at road equally
 Low attenders look around 20% more

Motorway – difference between high and low (20pt moving average)

Previous Findings

- 30-60% accidents due to distraction factors
- Much of the simulator based research has been concentrating on in-vehicle distraction factor(i.e.mobile phones, in-vehicle information systems)
- Experienced, as well as novice drivers, are likely to be distracted and involved in accidents

General Research Aims

- ▶ Investigate the complex relationship between the driver and road environment.
- ▶ Using-simple driving simulators, synchronised bio-feedback devices ~ (eye tracking, EEG).

Proposed Study

- ▶ To investigate the potential for distraction of additional structures on selected parts of the Irish road network
- ▶ Focus on distraction sources outside the vehicle
 - ▶ Eg- advertising hoardings, artworks, signage

To what extent will these structures cause a distraction?

Rural vs urban locations-will driver response vary ?

Will driver response settle over time?
